STORAGE RECOMMENDATIONS

HANDLING ADVICE

Presentation: semi-solid in block.

Lipid excipients are naturally composed of several fractions with different density values and crystallization temperatures. Semi-solid excipients in block form may stratify during crystallization resulting in a non-homogenous composition.

Samples should never be scooped from the top of the container as the contents will not be representative of the batch. It is essential that the entire contents of the container are fully melted to remove all crystallization clusters (by heating to at least 20° C above the drop point) and thoroughly stirred to ensure homogeneity prior to use/sampling.

For additional information, please consult the product handling sheet.
